0.0 Abstract

This document describes the proposal of a formation-flying coronagraph to be implemented on a space platform consisting of two tether-connected nano-satellites – Tether-Cor. The Tether-Cor optical concept comprises an occulter installed on one nano-satellite (Occulting Satellite) and a simple telescope hosted on the other satellite (Observing Satellite). The telescope's entrance pupil is in the shadow cast by the 0.38-m diameter occulter, 30 m away, towards the Sun. The optical system consists of a simple CCD-based web-camera with an objective lens and an afocal telescope for the suppression of the diffraction off the occulter.

1.0 Introduction

Externally occulted coronagraphs are telescopes whose entrance pupil is in the shadow of a screen ("external occulter") blocking the direct sunlight. This allows the observation of the solar corona that is several orders of magnitude fainter than the Sun (cfr. Figure 1). The distance between the external occulter (EO) and the Entrance pupil (EP) is the parameter that determines how close to the solar limb the corona can be observed. The longer this distance, the smaller is the view angle from the sun-center direction. Also, the longer is the EO-EP distance, the smaller is the EP vignetting. This improves the spatial resolution by reducing the diffraction.

In single-bench coronagraphs, the EO-EP distance is limited to 1-2 m. By separating the EO and the telescope on two different space platforms in formation flying, the EO-EP baseline can be extended to tens of meters. While the formation flying concept has already been proposed for coronagraphs, the use of tether-connected nano-satellites for a formation flying coronagraph (Tether- Cor) is a novel approach. In this concept, the limited attitude control available in nano-satellites is compensated by the tether connection that helps maintaining the relative attitude between the two satellites (i.e., formation flying). In the following, the Tether-Cor optical concept and implementation is described (Fineschi, 2009).

2.0 Optical concept of the tethered formation-flying coronagraph

The optical concept calls for an occulter to be installed on one nano-satellite (Occulting Satellite) and for a simple telescope to be hosted on the other nano-satellite (Observing Satellite). The optical payload consists of a simple CCD-based web-camera and an afocal telescope for the suppression of the diffraction off the occulter.

Figure 2 Conceptual layout of the tether-connected coronagraph

Figure 3 Coronagraph's occulter and telescope on the two tether-connected nano-satellites.

3.0 Nano-satellites platform for tethered formation-flying

The nano-satellites platform for tethered formation-flying and its specifications are described in Chiesa, S., Corpino, S., Viola, N., 2008.

4.0 Tether-Cor implementation

Table 1 shows the main characteristics of the Tether-Cor.

| Nano-satellites distance | 30 m |
|----------------------------|---|
| External occulter diameter | 380 mm |
| Optical payload dimension | $250 \text{ mm} \times 110 \text{ mm} \times 50 \text{ mm}$ |
| Coronagraph Fiel-of-View | 1.65 Ro – 5 Ro |

Table 1Tether-Cor main characteristics.

4.1 Occulter's diffraction

The occulter's diffraction has been calculated from the Fresnel integrals for a circular disk at 20 m (Figure 4) and 30 m (Figure 5) distance.

Figure 4 Diffraction profile off a 38-cm diameter occulter on 20-m tether

Figure 5 Diffraction profile off a 38 cm diameter occulter on a 30-m tether

4.2 Telescope's Optical Design

The optical specifications of the coronagraph's telescope are reported in Table 2. Figure 6 shows the optical layout.

| Telescope Overview | | | | |
|-------------------------------|---|--|--|--|
| Overall dimensions | $250 \text{ mm} \times 110 \text{ mm} \times 50 \text{ mm}$ | | | |
| Entrance aperture dia. | 20 mm | | | |
| Effective focal length | 100 mm (F/# = 5) | | | |
| Afocal Diffraction- | Afocal Diffraction-suppressing Optical System (ADOS) | | | |
| Parabolic mirror focal length | 120 mm | | | |
| Parabolic mirror dimensions | $30 \text{ mm} \times 100 \text{ mm}$ | | | |
| Parab. mirror rms roughness | $0.7 \text{ nm} (0.5 \text{ nm goal}) \text{ in sp. freq. } 0.1-0.01 \mu\text{m}^{-1}$ | | | |
| Flat reflector dimensions | $10 \text{ mm} \times 10 \text{ mm}$ | | | |
| Internal occulter hole dia. | 1.04 mm (0.9mm w/o \pm 0.07° max disalignm.) | | | |
| Imaging System | | | | |
| Objective lens dia. | 24 mm | | | |
| Objective focal length | 100 mm (F/# = 4) | | | |
| CCD sensing area | $3.6 \text{ mm} \times 2.7 \text{ mm}$ | | | |
| CCD pixel format | 510×492 (7 µm pixels) | | | |
| Plate scale | 14 arcsec/pixel | | | |
| Fiel-of-View | 1.45 Ro (1.65 Ro) – 4 Ro | | | |

Color Micro Standard-Res Board Level CCD Cameras

- Small Color Version
- Models With 3.8mm or 6mm Lens, or CS-Mount

Designed for direct system integration, Edmund Optics board level cameras provide a variety of solutions for machine vision, image processing, and surveillance applications. These cameras yield the performance and benefits of traditional boxed units, but without the added weight and size. Our selection includes standard and high resolution micro monochrome cameras, and some of the smallest color cameras currently available.

| Signal Format | NTSC | | | |
|-----------------------------|-------------------------------|-----------|----------|--|
| Interline Transfer CCD | 1/4" format | | | |
| Pixels (H x V) | 510 × 492 | | | |
| Horizontal Resolution | 330 TV Lines | | | |
| Sensing Area (H × V) | 3.6 x 2.7mm | | | |
| Video Output | Via 10" wire leads | | | |
| Lens Mount | CS-Mount or M13 x 1mm | | | |
| Back Flange Distance | 12.5mm (CS-Mo | unt) | | |
| Sync System | Internal Only | | | |
| Minimum Sensitivity (f/1.2) | <1.0 lux | | | |
| S/N Ratio | >50dB | | | |
| Electronic Shutter Speed | 1/60 - 1/20,000 sec | | | |
| Gamma | 0.45 | | | |
| Auto Gain Control | on 12dB | | | |
| Operating Temperature | -10°C to 50°C (14°F to 122°F) | | | |
| Power Requirement | 12V DC, 130 mA | | | |
| Power Supply | #53-256 | | | |
| Dimensions | 32mm W x 32mm H x 20mm L | | | |
| Weight | 30g | | | |
| Lens Options | 3.8mm | 6.0mm | CS-Mount | |
| Aperture (f/#) | f/2 | f/2.5 | no lens | |
| Field of View | 55° × 40° | 35° x 26° | no lens | |
| Minimum Working Distance | 0.20m | 0.25m | no lens | |
| Stock No. | #53-314 | #53-315 | #53-316 | |
